Storing API Data Locally

James Millar
FREELANCE SOFTWARE DEVELOPER
@jamesmillar www.james-millar.co.uk

Overview

Explore the Storage API

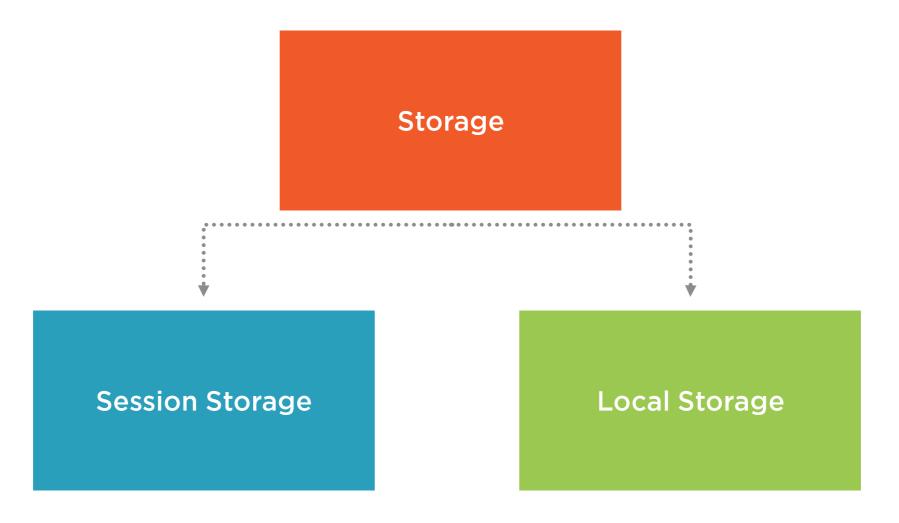

Create shopping cart

Storing API data

- Complex objects
- Storing in local storage
- Retrieving from local storage

Storage API

Storage Interface

```
interface Storage {
readonly attribute unsigned long length;
DOMString? key(unsigned long index);
getter DOMString? getItem(DOMString key);
setter undefined setItem(DOMString key, DOMString value);
deleter undefined removeItem(DOMString key);
undefined clear();
```

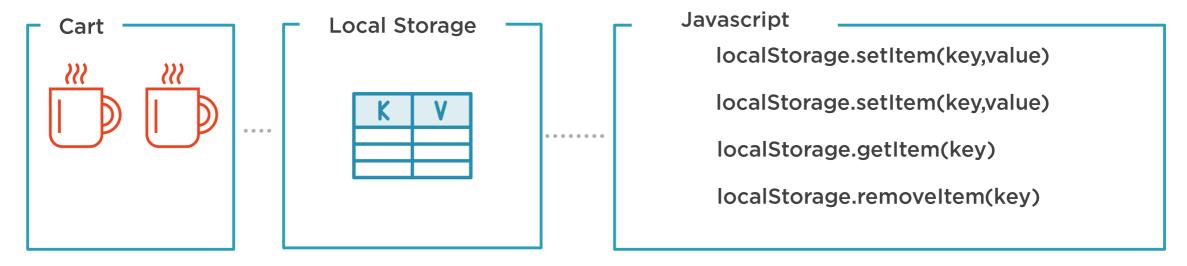

Check Support for Storage API

```
if (typeof(Storage) !== "undefined") {
   // local storage and session storage are available
}
else {
   // no support for the storage API
}
```

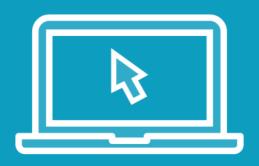

Working with Storage

Demo

Implement the shopping cart

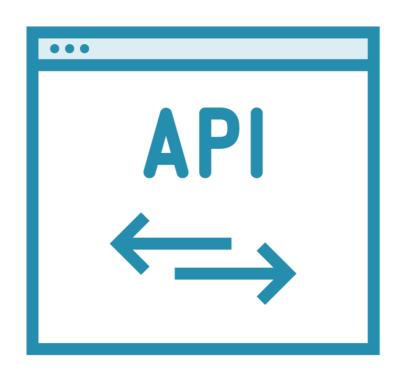

- Local storage

Working with a REST API

Storing REST API Data

Data dependent

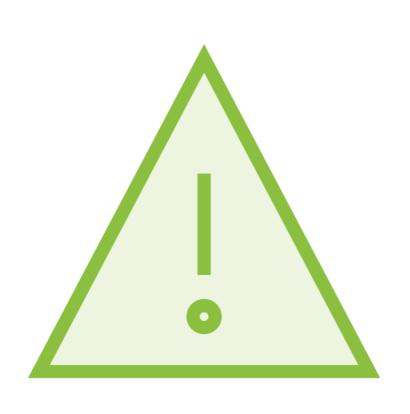

Reduces outbound network traffic

More responsive

Data stored as strings

Storage API Issues

Functions are synchronous

No access from web workers

Vulnerable to XSS attacks

Don't store sensitive data

Saving Data as Strings

```
saveCart: function (object) {
    var stringified = JSON.stringify(object);
    localStorage.setItem(cartId, stringified);
    return true;
}
```

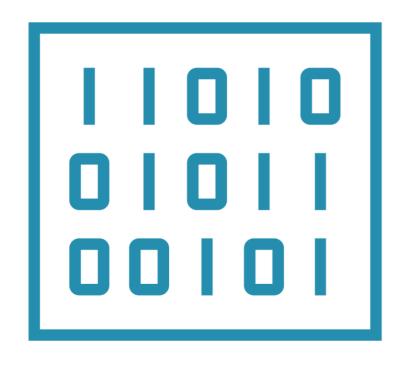

Reading Data

```
getCart: function () {
    return JSON.parse(localStorage.getItem(cartId));
}
```

Storing Complex Data

Challenging

- XML
- Images
- Files

Convert data with a parser

Consider performance

Use alternative storage for complex data

Demo

Retrieve product data from API
Store in local storage

Demo

Get product data from local storage

Summary

Explored the storage API
Implemented the shopping cart

Storing data

- Advantages
- Disadvantages

Store API data and display it
